

4 New MatrixGold® Features for Spring

It has been a successful year around the world with MatrixGold!

In the last year, MatrixGold's new core and dynamic commands have provided a new way to design jewelry. It has been a pleasure to see our customers utilize the new functionalities of the software to speed up their production time.

With MatrixGold being a popular CAD software in jewelry design, we want to continuously offer features to provide state-of-the-art software to our customers. We believe

the only way to make good software is by listening to our customers, who spend hours working with the product, and then by putting all these experiences and feedback into developing new MatrixGold features. This month, a new version will be available to users.

Without further ado, we're excited to present a sample of our new MatrixGold features. Here are four!

New MatrixGold Features for Spring 2020

- **Pavé prongs:** You'll be able to add prongs to a group of stones. Automatically, MatrixGold will add prongs where the spaces between stones are.
- **Manufacturing tools:** In just a few clicks, you can get your design ready for 3D printing and then casting.
- **Animation studio:** We improved the animation studio as the move maker from what you will be able to make movies from frames.
- **New profile editor functionalities:** The profile editor is a tool used to personalize your jewelry. We improved and added to its functionality so you can create your own profiles and save them to use later.

[*Visit the Gemvision YouTube for a look at these features firsthand.*](#)

Even as we announce this new version, we are looking ahead to JCK Las Vegas in early June to meet all our customers with even more new tools.

Happy designing!

What do you hope to design with the new MatrixGold update? Let

us know in the comments below!
